

## Volume, Mass and Density

Mass refers to the weight of an object and is measured in Kilogram's(kg)

Density is mass per unit volume and is measured in Kg/m<sup>3</sup>

If the volume and density of a material is known, the mass(weight) can be calculated:

$$\text{Mass} = \text{Density} \times \text{Volume}$$

(This formula can also be expressed for Mass or Volume through transposition)

**Example:** Calculate the volume of concrete required for the cylindrical column shown, and from this, calculate the weight of the column if the density of concrete is 2400 kg/m<sup>3</sup>  
(Vol. of cylinder =  $\pi r^2 h$ )  
Diameter = 500mm, Height = 4m

**Answer:**

$$\begin{aligned}\text{Volume} &= \pi r^2 h \\ &= \pi \times 0.25^2 \times 4 \\ &= 0.785\text{m}^3\end{aligned}$$

$$\begin{aligned}\text{Mass} &= \text{Density} \times \text{Volume} \\ &= 2400 \times 0.785 \\ &= \mathbf{1884\text{kg}}\end{aligned}$$

## Volume, Mass and Density - (Questions)

Q.1 Calculate the mass (weight) of the timbers listed below:

Norway Spruce (white deal) Density =  $470 \text{ kg/m}^3$

European Redwood (red deal) Density =  $515 \text{ kg/m}^3$

American Red Oak Density =  $790 \text{ kg/m}^3$

Greenheart Density =  $1040 \text{ kg/m}^3$

( assume a plank size in each case of  $2\text{m} \times 300\text{mm} \times 75\text{mm}$ )

Q.2 An ornamental stone sphere has a diameter of  $0.5\text{m}$ . If the density of the stone is  $2640 \text{ kg/m}^3$ , find the mass of the sphere.

(volume of sphere =  $\frac{4}{3} \pi r^3$ )

Q.3 A large concrete pre-cast cladding panel is to be lifted into place by a crane. The maximum lifting capacity of the crane is 10 tonnes ( $1,000\text{kg} = 1 \text{ tonne}$ ). Find out if the crane will be able to lift the pre-cast panel? (Density of Concrete is  $2400 \text{ kg/m}^3$ )

Q.4 When deciding on whether to use a timber or steel beam, a contractor wants to know how much heavier one is than the other. The timber beam ( $3.5\text{m} \times 225\text{mm} \times 75\text{mm}$ ) has a density of  $720 \text{ kg/m}^3$ .

Compare the mass (weight) of the timber beam with that of a steel beam of the same length which has a mass of  $30 \text{ kg}$  per meter run.

Q.5 A builder incorrectly estimates that he needs  $172 \text{ m}^3$  of concrete for the pour in an apartment block being built, and is charged € 11,180. When the pour is finished he has enough left over to form a wall ( $10\text{m} \times 2 \text{ m} \times 200\text{mm}$ ), and also to pour a section of footpath ( $20\text{m} \times 3.5 \text{ m} \times 150\text{mm}$ ).

- (a) How much concrete did he originally require?
- (b) How much did it cost him for (i) the wall?  
and (ii) the path?

## Volume, Mass and Density - (Answers)

Q.1 Volume of plank =  $2\text{m} \times 0.3\text{mm} \times 0.075\text{mm} = 0.045\text{m}^3$

*(Mass = Density x Volume)*

Norway Spruce =  $0.045 \times 470 = 21.15 \text{ kg}$

European Redwood =  $0.045 \times 515 = 23.175\text{kg}$

American Red Oak =  $0.045 \times 790 = 35.55 \text{ kg}$

Greenheart =  $0.045 \times 1040 = 46.80 \text{ kg}$

Q.2 Volume of sphere =  $\frac{4}{3} \pi r^3 = \frac{4}{3} \times \pi \times 0.25^3$   
 $= 1.333 \times \pi \times 0.015625$   
 $= 0.0654\text{m}^3$

*(Mass = Density x Volume)*

=  $2640 \times 0.0654$

=  $172.656 \text{ kg}$

Q.3 Volume =  $(4.5 \times 3.6 \times 0.3) - (1.8 \times 1.2 \times 0.3)$   
 $= 4.86 - 0.648$   
 $= 4.212\text{m}^3$

*(Mass = Density x Volume)*

=  $2400 \times 4.212$

=  $10108.8 \text{ kg}$  (1,000 kg = 1 tonne)

=  $10.109 \text{ tonnes}$  (so crane can't lift it)

Q.4 Volume of timber beam =  $3.5\text{m} \times 0.225\text{m} \times 0.075\text{m} = 0.059\text{m}^3$

*(Mass = Density x Volume)*

=  $720 \times 0.059 = 42.48\text{kg}$

=  $42 \text{ kg}$

Steel beam mass =  $3.5 \times 30$  (30kg for every meter run)

=  $105 \text{ kg}$

**Answer: Steel beam is 2.5 times heavier than wooden beam**

Q.5 (a) Wall =  $10 \times 2 \times 0.2 = 4\text{m}^3$

Path =  $20 \times 3.5 \times 0.15 = 10.5\text{m}^3$

(wall + path) =  $14.5\text{m}^3$

Total concrete – (wall + path) = Originally needed

$172\text{m}^3 - 14.5\text{m}^3 = 157.5\text{m}^3$

(b)  $1\text{m}^3$  concrete costs € 65 (11,180 / 172 = 65)

(i) Wall =  $10 \times 2 \times 0.2 = 4\text{m}^3 \times € 65 = € 260$

(ii) Path =  $20 \times 3.5 \times 0.15 = 10.5\text{m}^3 \times € 65 = € 682.50$

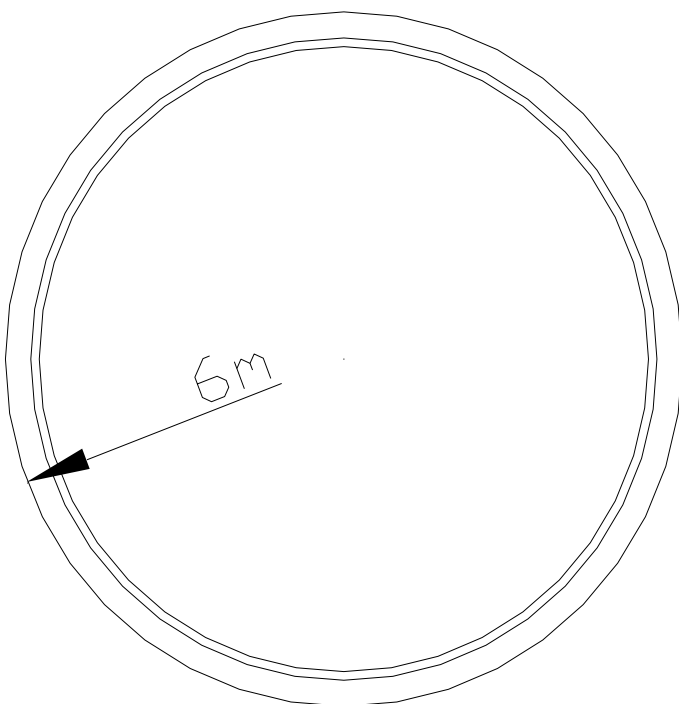

## QUESTIONS ON VOLUME AND AREA

- Q. 1 Calculate the volume of concrete required to fill a column 400mm x 400mm at the base and 2.75m high.
- Q. 2 Calculate the volume of concrete required to fill a beam 400mm deep x 300mm wide x 4.1m long
- Q. 3 Calculate the volume of a length of timber measuring 112mm x 44mm x 4.8m
- Q. 4 How many metres of 115mm wide flooring are required to cover a floor measuring 4.9m x 3.25m?
- Q. 5 Calculate the number of linear metres of floorboards required to cover a floor measuring 3.65m x 2.85m if the boards are 80mm wide.

- Q. 6 The length of a ridge board is 19.5m and the common rafter length is 4.8m. Calculate the number of tiles required to cover the roof if one tile covers an area of 300mm x 300 mm.

- Q. 7 Calculate the volume of concrete required for the roundabout shown in plan and in sectional detail below.

## QUESTIONS ON VOLUME AND AREA (ANSWERS)

Q. 1 Volume =  $2.75 \times 0.4 \times 0.4 = 0.44\text{m}^3$

Q. 2 Volume =  $4.1 \times 0.4 \times 0.3 = 0.492\text{m}^3$

Q. 3 Volume =  $4.8 \times 0.112 \times 0.044 = 0.024\text{m}^3$

Q. 4 Area =  $4.9 \times 3.25 = 15.925\text{m}^2 / 0.115 = 138.478$   
= 139m of flooring

Q. 5 Area =  $3.65 \times 2.85 = 10.4025\text{m}^2 / 0.080 = 130.031$   
= 131m of flooring

Q. 6 Area =  $19.5 \times 4.8 \times 2 = \underline{187.2\text{m}^2}$   
Area of tile =  $0.3 \times 0.3 = 0.09\text{m}^2$  = 2080 tiles

Q. 7 Total Vol. = Vol. of Cylinder + Vol. of Frustum – (Vol. of Cylinder)  
(in bottom portion) (in top portion) (hollow in centre)

Vol. Of Cylinder =  $\pi r^2 h$   
(in bottom portion) =  $\pi \times 3^2 \times 0.150$  =  $4.241\text{m}^3$

Vol. Of Frustum =  $\frac{1}{3} \pi h (R^2 + Rr + r^2)$   
(in top portion) =  $\frac{1}{3} \times \pi \times 0.3 (3^2 + \{3 \times 2.7\} + 2.7^2)$   
=  $\frac{1}{3} \times \pi \times 0.3 (24.39)$  =  $\underline{7.662\text{m}^3}$   
Total Volume including centre =  $11.903\text{m}^3$

Less Vol. Of Cylinder =  $\pi r^2 h$   
(hollow portion in centre) =  $\pi \times 2.6^2 \times 0.45$  =  $\underline{9.557\text{m}^3}$   
Total Volume of Concrete =  $2.346\text{m}^3$
